(54) Title: REVERSIBLY COLLAPSIBLE/ERECTABLE CONTAINER

(57) Abstract: A foldable open-top container is constructed from a single sheet 1 of material having fold lines (4,7) enabling the sheet to be transformed into the container by folding. The container has a base (3) and side walls (16) that extend from the base and define a rim (5). The side walls are joined at each end by corners (11). Each corner is a flap formed from the two fold lines. The flap has an outside part (8c) that extends into one side wall, an inside part (8b) that extends into the adjoining side wall, and a middle part (8a) between the inside and outside parts. A first integral formation on one of said parts (notch 12) is interlocked with another of said parts (notch 14) to retain the flap in a folded condition.
